The Basics Some basic things you may have forgotten include that Photoshop's toolbar consists of five circles representing the most commonly used tools, as shown in Figure 1. You can customize the functions and items in Photoshop in any way that works best for you. By default, the most commonly used tools are placed in the bottom left, then the secondary tools in the top left, while the fifth option, the first customizable in most tutorials, is used for "drawing" objects. When the tool is not selected, the default tools will appear in the bottom left of the screen. This is often used to create an object on a layer and then switch to another tool to continue editing that layer. Selecting the first tool will also bring the rest of the tools into view, as

shown in Figure 2. Figure 1: The default Photoshop tool bar. Figure 2: To customize your tool bar, open the Photoshop Options dialog box from the Edit pulldown menu or from the Controls menu on the left side of the screen. You'll need to have an understanding of Layers and Groups if you want to do much with the way an image will be displayed and organized. Most of the tools and commands will render a layered image. You can preview your work in the Layers palette. You'll get a better idea of what's happening when you open and work on an image with multiple layers. You'll see a separate icon for each layer. When you create a new layer, it will be called a new layer with the layer name and the layer icon will appear in the Layers palette. You can delete layers if you no longer need them, rename them, or

delete them. You can modify the attributes of a layer by clicking on it and making changes in the dialog box. Photoshop has layers that are visible to the left side of the canvas, visible to the right side of the canvas, and in the bottom and in the top. This is called a visible or active layer. You have the power to show or hide any layer. To hide a layer simply click the leftmost cross next to the layer, as shown in Figure 3. A red "x" will appear in the center of the layer; if you don't click it, it will be shown. To show a layer, double-click it in the Layers palette. [Evaluation of moxidectin acaricide (Immiticide) as a treatment against the cattle biting louse (Boophilus microplus) (author's transl)]. Moxidectin acaricide (Immiticide) was orally administered to twelve female calves. The animals were divided into three groups (n = 4 in each group). In the first group, 0.4 mg/kg of moxidectin was administered via the drinking water once a week for four consecutive weeks. In the second group, the same amount of acaricide was given once a week for the duration of the experiment. In the third group, 0.4 mg/kg of moxidectin was administered for seven consecutive days followed by one week of no treatment. The cattle biting louse (Boophilus microplus) was not found in any of the calves

before treatment. Boophilus microplus infestation was established after seven days of treatment in the first group and after 28 days of treatment in the second group. The third group did not show Boophilus microplus infestation and from the results of this group, it was concluded that one week of drug-free period was enough to make the cattle free from Boophilus microplus. The cattle biting louse was found one week after the last treatment. There were no adverse effects on the cattle with the doses used in the experiment.Q: how to print, say, the first 10 elements of an array, and ignore the rest I'm trying to print out an array until I hit the first '#'. say for instance if I had this: $nums = array(1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21); print $nums[0...9]; I know the above code doesn't work, but I'm looking

for a way to make it work. A: use array_slice to get what you want. E.g. $array = array(0, 1 ,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,1 9,20,21); $begin = 0; $end = 9; $get
